

$$\vec{S}_1 \times \vec{S}_2 = \det \begin{bmatrix} 1 & 0 & 0 \\ \cos(\theta) & \sin(\theta) & -2r \\ -r\sin(\theta) & r\cos(\theta) & 0 \end{bmatrix} = \langle 2r^2\cos(\theta), 2r^2\sin(\theta), r\cos^2\theta + r\sin^2\theta \rangle = r \langle 2r\cos(\theta), 2r\sin(\theta), 1 \rangle$$

$$\begin{aligned} & \cos(1(\vec{F})(\vec{S}(r, \theta))) \cdot (\vec{S}_1 \times \vec{S}_2) \\ &= -r(2r^2\sin(\theta)\cos(\theta) + r(1-r^2)r\sin(\theta) + r\cos(\theta)) \\ &= -r^2(r\sin(2\theta) + 2(1-r^2)\sin(\theta) + \cos(\theta)) \end{aligned}$$

$$\int_{S_2} \vec{F} \cdot d\vec{r} = \iint_S \cos(1(\vec{F})) \cdot d\vec{S}$$

$$= \int_{r=0}^1 \int_{\theta=0}^{2\pi} -r^2(r\sin(2\theta) + 2(1-r^2)\sin(\theta) + \cos(\theta)) d\theta dr$$

$$= \int_{r=0}^1 \left[ -\frac{1}{2} r (\cos(2\theta) - 2(1-r^2)\cos(\theta) + \sin(\theta)) \right]_0^{2\pi} dr$$

$$= \int_{r=0}^1 -r^2 \left[ \frac{1}{2} r (-1-1) - 2(1-r^2)(0-1) + (1-0) \right] dr$$

$$= \int_{r=0}^1 -r^2 (r + 2(1-r^2) + 1) dr = \int_{r=0}^1 -r^2 (2r^2 + r + 3) dr$$

$$= \int_{r=0}^1 (2r^4 - r^3 - 3r^2) dr = \left[ \frac{2}{5}r^5 - \frac{1}{4}r^4 - r^3 \right]_{r=0}^1 = \frac{2}{5} - \frac{1}{4} - 1 = -\frac{3}{20} - 1 = -\frac{23}{20}$$

12/6/21 Divergence Theorem:

Idea: yet another generalization of green's theorem we saw, that we could state Green's Theorem as:

$$\int_{\partial D} \vec{F} \cdot \vec{n} ds = \iint_D \text{div}(\vec{F}) dA$$

Divergence Theorem: Suppose that  $R$  is a simple solid region in  $\mathbb{R}^3$  with piecewise smooth bounding surface alone component  $\rightarrow$

Note: a simple solid is a region of  $\mathbb{R}^3$  which "has no holes" and has one component to its bounding surface

⊙ example

i.e. the solid has a paracuboid may of the integration orders i.e.  $\int_0^1 \int_0^1 \int_0^1 dx dy dz$ ,  $\int_0^1 \int_0^1 \int_0^1 dy dx dz$  etc.)

12/6/21

Divergence theorem cont.

$$\iint_{\partial R} \vec{F} \cdot d\vec{S} = \iiint_R \text{div}(\vec{F}) \, dV$$

Ex: Compute the Flux of  $\vec{F} = \langle x, y, x \rangle$  across the unit sphere at the origin.

Sol: we're asked to compute boundary

$\iint_S \vec{F} \cdot d\vec{S}$  vs. MWR:  $\partial R$  for  $R$  is solid unit disk at the origin.

$$\iint_S \vec{F} \cdot d\vec{S} = \iint_{\partial R} \vec{F} \cdot d\vec{S} = \iiint_R \text{div}(\vec{F}) \, dV = \iiint_R (0+1+0) \, dV = \iiint_R 1 \, dV$$

Divergence theorem

$$\text{Vol}(R) = \frac{4}{3}\pi(1^3) = \frac{4}{3}\pi$$

Ex: compute  $\iint_S \vec{F} \cdot d\vec{S}$  for  $\vec{F} = \langle xy, y^2 + x^2, \sin(xy) \rangle$  for  $S$  the surface of the region  $R$  bounded by

$$z = 1 - x^2, z = 0, y = 0, y + z = 0$$

Picture

$$R = \{(x, y, z) : -y \leq z \leq 1 - x^2, -\sqrt{1-x^2} \leq y \leq 0, -1 \leq x \leq 1\}$$

Sol: Applying divergence theorem:

$$\iint_{\partial R} \vec{F} \cdot d\vec{S} = \iiint_R \text{div}(\vec{F}) \, dV$$

$$\text{div}(\vec{F}) = \nabla \cdot \vec{F} = \frac{\partial}{\partial x} [xy] + \frac{\partial}{\partial y} [y^2 + x^2] + \frac{\partial}{\partial z} [\sin(xy)] = y + 2y - 0 = y + 2y = 3y$$

Now we can parametrize  $R$  in cylindrical coordinates via  $x = r \cos \theta, y = r \sin \theta, z = z$

$$R_{xy} = \{(r, \theta, z) : -r \sin \theta \leq z \leq 1 - r^2, 0 \leq \theta \leq \pi\}$$

11/11/21

Change bounds to  $z = 1 - x^2 - y^2$ ,  $z = 0$

$$\iint_{\partial R} \vec{F} \cdot d\vec{S} = \iiint_R \text{div}(\vec{F}) dv$$

$$\text{div}(\vec{F}) = \nabla \cdot \vec{F} = 2y \quad R_{\text{cyl}} = \{(r, \theta, z) : 0 \leq r \leq 1, 0 \leq \theta \leq 2\pi, 0 \leq z \leq 1 - r^2\}$$

$$\begin{aligned} - \iiint_{R_{\text{cyl}}} \text{div}(\vec{F})(r, \theta, z) r dr d\theta dz &= \int_{r=0}^1 \int_{\theta=0}^{2\pi} \int_{z=0}^{1-r^2} 3r^2 \sin(\theta) z dz d\theta dr \\ &= \int_{r=0}^1 \int_{\theta=0}^{2\pi} 3r^2 \sin(\theta) [z]_{z=0}^{1-r^2} d\theta dr = \int_{r=0}^1 \int_{\theta=0}^{2\pi} 3r^2 (1-r^2) \sin(\theta) d\theta dr \\ &= \int_{r=0}^1 3r^2 (1-r^2) [-\cos(\theta)]_{\theta=0}^{2\pi} dr = \int_{r=0}^1 0 dr = 0 \end{aligned}$$

Exercise: repeat for  $R$  bounded by  $z = 1 - x^2 - y^2$ ,  $z = 0$  with  $y \leq 0$

Ex: Calculate the Flux of  $\vec{F} = (xe^y, z - e^y, -xy)$   
across the ellipsoid  $x^2 + 2y^2 + 3z^2 = 4$

Sol: let's apply the divergence theorem:

$R$ , the solid ellipsoid yields

$$\iint_{\partial R} \vec{F} \cdot d\vec{S} = \iiint_R \text{div}(\vec{F}) dv$$

$R$  parametrized by a modification of spherical coordinates

$$\left(\frac{x}{\sqrt{6}}\right)^2 + \left(\frac{y}{\sqrt{3}}\right)^2 + \left(\frac{z}{\sqrt{2}}\right)^2 = \frac{4}{6} = \frac{2}{3} \quad \left(\frac{x}{\sqrt{6}}\right)^2 + \left(\frac{y}{\sqrt{3}}\right)^2 + \left(\frac{z}{\sqrt{2}}\right)^2 = \frac{2}{3}$$

$$x = \sqrt{6} \rho \sin(\phi) \cos(\theta)$$

$$y = \sqrt{3} \rho \sin(\phi) \sin(\theta)$$

$$z = \sqrt{2} \rho \cos(\phi)$$

under the substitution,  $\left(\frac{x}{\sqrt{6}}\right)^2 + \left(\frac{y}{\sqrt{3}}\right)^2 + \left(\frac{z}{\sqrt{2}}\right)^2 = \frac{2}{3}$  iff  $\rho^2 = \frac{2}{3}$   
therefore,  $\rho$  parametrizes solid ellipsoid,

$$R_{\text{ell}} = \{(\rho, \theta, \phi) : 0 \leq \theta \leq 2\pi, 0 \leq \phi \leq \pi, 0 \leq \rho \leq \sqrt{\frac{2}{3}}\}$$

→

14/6/21

$$\iiint_{V_{\text{new}}} dV(\vec{F})_{\text{new}} \left| \frac{\partial(x, y, z)}{\partial(\rho, \theta, \phi)} \right| dV_{\text{new}}$$

$$\text{jacobian} = \rho^2 \sin(\theta)$$

$$\text{div}(\vec{F}) = \nabla \cdot \vec{F} = e^y - e^y + 0 = 0$$

$$\therefore \iint_{\partial R} \vec{F} \cdot d\vec{S} = \iiint_R 0 \, dV = 0$$
